

1. When does the error #VALUE! occur?

The #VALUE! error occurs when a formula uses the wrong type of data, such as text instead of numbers.

2. How can you identify and correct the '#NAME?' error in a formula?

This error happens when Excel does not recognize a function or name.

To fix it:

Check spelling of the function

Ensure correct function name is used

Add missing quotation marks (if text is used)

3. How do you create an absolute reference in a formula?

By adding the \$ (dollar) symbol before the column and row.

Example: \$A\$1

4. What is the cell range? How to define a cell range in Excel?

A cell range is a group of cells.

It is defined using the starting and ending cell separated by a colon.

Example: A1:A5

5. What are the steps to enter a formula in the formula bar?

Select a cell

Click on the formula bar

Type = and enter the formula

Press Enter

6. How do you use the MOD function, and what does it return?

The MOD function is used as:

=MOD(number, divisor)

It returns the remainder after division.

7. Write any three tips to avoid errors while using formula and function.

Check correct cell references

Use proper function names and syntax

Ensure correct data types (numbers, text, etc.)
